

GI Tract Normal Histology

Gastrointestinal Tract Introduction

- The GI tract is the part of an organ system in humans that takes in food, digests it, absorbs nutrients, and expels it in the form of feces.
 - **Stomach:** mechanical disruption of food and some enzymatic digestion
 - **Small intestine:** enzymatic digestion and solubilization into small molecules, and absorption of small molecules
 - **Large intestine (colon):** processing of unabsorbed material into waste
 - Other organs, such as the **liver and pancreas**, contribute enzymes and other material to the gastrointestinal tract that help with digestion and the solubilization of food.

GASTROINTESTINAL TRACT

Layers of Gastrointestinal Tract

Esophagus

Stomach

Stomach

Mucus Cells

Lumen

Parietal Cell

Small intestine

Amplification of Surface Area

Large intestine, colon

Recto-Anal Junction

Urinary tract

Anatomy of the Kidney

Kidney (low power):

A section of the kidney showing the renal cortex and medulla. Renal corpuscles are only found in the renal cortex.

Kidney (low power):

A section of the kidney showing the renal cortex and renal medulla. Renal corpuscles are only found in the renal cortex.

Kidney (high power):

Renal cortex showing renal corpuscles, proximal and distal convoluted tubules.
